

# 4 TIPS ON CARING FOR YOUR *Summer Lawn*

1

## FERTILIZE & FEED YOUR LAWN

Fertilizers and Lawn Foods help green your lawn and feed the soil. They aid in moisture retention helping your lawn use less water while maintaining consistent growth and develop strong roots.

2

## WATER PROPERLY

The typical lawn needs 1 inch of water per week. The healthiest grass prefers deep and infrequent watering. This promotes stronger root development, reduces chance for disease, and improves air movement around the roots.

3

## MOW CORRECTLY

When cutting the lawn, no more than 1/3 of your grass leaf surface should be removed. Taller grass shades the soil and helps eliminate evaporation.

4

## PEST CONTROL

It is always important to treat for pests to keep your lawn safe from infestations and diseases, and to protect you and your family.
